FMI-ARC	Arctic Research Station of Finnish Meteorological Institute in Sodankylä
LAI	Leaf Area Index
NorSEN	Nordkalotten Satellite Evaluation co-operation Network
SAF	Satellite Application Facility, project type of EUMETSAT
SNORTEX	Snow Reflectance Transition Experiment

## Summary

This report describes the leaf area index (LAI) data sets gathered in the region around the surroundings of the Arctic Research Centre of FMI at Sodankylä in 2007 - 2010.

The ground based results are listed in tables of the Appendix. Every LAI value is provided the latitude and longitude co-ordinates. The dates and UTC times of the measurements are given as well. Some of the measurements include information about the dominant species.

The airborne data constitutes a vast data set, so that it is not possible to include the individual LAI values in this report. Therefore a table and a set of figures are presented to give the basic characteristics of the airborne LAI data sets.

## Introduction

The leaf area index (LAI) data sets reported in this document were measured in Sodankylä region during the NorSEN (Nordkalotten Satellite Evaluation co-operation Network) campaign in 2007 and during the SNORTEX (Snow Reflectance Transition Experiment) campaign in 2008-2010 (Manninen and Roujean, 2014). During the SNORTEX campaign the ground based LAI values were measured both in summer and winter conditions, during the NorSEN campaign only in summer conditions. Airborne measurements were carried out in winter/spring conditions during the SNORTEX campaign 2008 – 2010. Use of the data described in this document is free on the condition that reference is made to the following publications:

Manninen, Terhikki, Lauri Korhonen, Pekka Voipio, Panu Lahtinen and Pauline Stenberg, 2009, "Leaf Area Index (LAI) Estimation of Boreal Forest Using Wide Optics Airborne Winter Photos", *Remote Sensing*, 2009, *1*(4), 1380-1394.

Manninen, Terhikki, Lauri Korhonen, Pekka Voipio, Panu Lahtinen and Pauline Stenberg, 2011, "Airborne estimation of boreal forest LAI in winter conditions: A test using summer and winter ground truth", *IEEE Transactions on Geoscience and Remote Sensing*, Vol. 50, No.1, pp-68-74, 10.1109/TGRS.2011.2173939.

## 1 Description of LAI measurements

### 1.1 Ground based measurements

During the NorSEN field campaign in July- September 2007 LAI measurements were carried out using LAI2000 instrument or hemispherical photos. The images were analysed in University of Eastern Finland by Lauri Korhonen. During the SNORTEX campaign LAI measurements were based solely on hemispherical photos. In 2008 a larger set of LAI data was gathered in August - September and in winter during the campaign 8 test sites matching airborne vertical profiling sites were measured. In 2009 hemispherical photos were taken in individual locations, mostly at the meteorological mast of FMI-ARC. In 2010 hemispherical photos were taken in 40 points and marked with black crosses, so that the airborne and ground based LAI measurements could be co-located with high accuracy. Results are described in Manninen et al. 2009 and Manninen et al. 2011.

### 1.2 Airborne measurements

A normal Canon pocket camera with wide optics was attached to the helicopter looking orthogonally downwards (Manninen et al., 2009; Manninen et al., 2011, Manninen and Roujean 2014). The images were taken every 3 seconds and the GPS coordinates (latitude, longitude and height from sea level) and time were registered for each image frame. In 2009 and 2010 there was an additional pressure gauge for altitude registration, as the vertical coordinate of GPS is not so accurate. The images were stored directly to a laptop used for operating the camera. The camera was on during most flights, but specific vertical LAI profiles were measured in March 13, 2009 and in March 19, 2010. The main facts concerning the airborne LAI data are listed in Table 1. The number of individual LAI values is so large, that it is not possible to list them in the Appendix like the ground based measurements. To

give and idea about the LAI variation its value is plotted for each flight as a continuous curve (Figure 1, Figure 3, Figure 5). In addition, the spatial LAI variation is demonstrated by plotting the LAI values as points in the co-ordinates so, that the size of the point is related to the LAI value (Figure 2, Figure 4, Figure 6).

Table 1. The airborne LAI data gathered is stored in the following files.

File name	Date	Latitude range	Longitude range	Altitude range (m)	Number of points
SNORTEX_20080330_20080402	March 30, 2008 April 2, 2008	67.27 – 67.93	24.91 – 26.72	160 - 400	43 + 203
